Soils

Generalized Onsite Septic Suitability

Town Plan Map 9 of 9
Brookfield, Vermont
Adopted: September 12, 2016

Moderately Suiited

This group is composed of soil map units that are generally not very well suited for on-site disposal systems. A majority of these soils have a lower degree of permeability than Group I. They require an intensive on-site assessment to determine suitability for an on-site disposal system. In general, these soils have a gravel or cobble bed near the surface. Areas of moderately suited soils may not be suitable for on-site disposal systems.

Marginally Suiited

This group is composed of soil map units that are generally not well suited for on-site disposal systems. A majority of these soils are poorly drained. Areas of marginal suited soils may not be suitable for on-site disposal systems.

Not Suitable

This group is composed of soil map units that are generally not well suited for on-site disposal systems.
