

# 11. Energy

## A. Introduction

The primary purpose of this chapter is to identify a path to implement [Vermont’s 2022 Comprehensive Energy Plan<sup>1</sup>](#) (CEP) at the regional level. As the CEP goals, federal and state policies, and energy technologies change, this chapter will need to be updated. Regional energy planning has benefited from technical support from the Vermont Department of Public Service (PSD), the Vermont Energy Investment Corporation (VEIC), the Energy Action Network (EAN), Green Mountain Power (GMP), Washington Electric Cooperative (WEC), and other organizations.

## B. Background

Vermont’s energy planning began in response to the oil crisis of the 1970s. The first comprehensive state energy plan was created in 1991 and required periodic updates. The most recent update was completed in 2022. Vermont’s energy policy, as codified in [30 VSA § 202a<sup>2</sup>](#), establishes these state goals:

- "To assure, to the greatest extent practicable, that Vermont can meet its energy service needs in a manner that is adequate, reliable, secure, and sustainable; that assures affordability and encourages the state’s economic vitality, the efficient use of energy resources, and cost-effective demand side management; and that is environmentally sound.
- “To identify and evaluate, on an ongoing basis, resources that will meet Vermont’s energy service needs in accordance with the principles of reducing greenhouse gas emissions and least-cost integrated planning,

24 including efficiency, conservation, and load management alternatives; wise  
25 use of renewable resources; and environmentally sound energy supply. “To  
26 meet Vermont’s energy service needs in a manner that will achieve the  
27 greenhouse gas emissions reductions requirements pursuant to 10 V.S.A §  
28 578 and is consistent with the Vermont Climate Action Plan adopted and  
29 updated pursuant to 10 V.S.A. § 592.”

30 The **2022 Comprehensive Energy Plan (CEP)** established the following set of goals:

- 31 • In the transportation sector, meet 10% of energy needs from renewable  
32 energy by 2025 and 45% by 2040.
  - 33 ○ Zero-emissions vehicles account for 100% of light-duty vehicle sales  
34 by 2035.
- 35 • In the thermal and industrial process sector, meet 30% of energy needs  
36 from renewable energy by 2025 and 70% by 2042.
- 37 • In the electric sector, meet 100% of energy needs from carbon-free  
38 resources by 2032, with at least 75% from renewable energy.
- 39 • Weatherize 120,000 households by 2030, relative to a 2008 baseline.

40 Vermont statutes related to energy—requiring greenhouse gas reductions,  
41 renewable energy generation and building efficiency—are outlined below.

42 **Greenhouse gas reduction goals ([10 VSA § 578<sup>3</sup>](#))**

- 43 • “Greenhouse gas reduction requirements. Vermont shall reduce emissions  
44 of greenhouse gases from within the geographical boundaries of the State  
45 and those emissions outside the boundaries of the State that are caused by

46 the use of energy in Vermont, as measured and inventoried pursuant to  
47 section 582 of this title, by:

48 ○ “not less than 26 percent from 2005 greenhouse gas emissions by  
49 January 1, 2025 pursuant to the State’s membership in the United  
50 States Climate Alliance and commitment to implement policies to  
51 achieve the objectives of the 2016 Paris Agreement;

52 ○ “not less than 40 percent from 1990 greenhouse gas emissions by  
53 January 1, 2030 pursuant to the State’s 2016 Comprehensive Energy  
54 Plan; and

55 ● “not less than 80 percent from 1990 greenhouse gas emissions by January  
56 1, 2050 pursuant to the State’s 2016 Comprehensive Energy Plan.”

57 **25 by 25 state goal ([10 VSA § 580<sup>4</sup>](#))**

58 ● “It is a goal of the State, by the year 2025, to produce 25 percent of the  
59 energy consumed within the State through the use of renewable energy  
60 sources, particularly from Vermont’s farms and forests.”

61 **Building efficiency goals ([10 VSA § 581<sup>5</sup>](#))**

62 ● “To improve substantially the energy fitness of at least 120,000 housing  
63 units and reduce greenhouse gas emissions by 0.15 MMTCO<sub>2</sub>e by 2031.

64 ● “To reduce annual fuel needs and fuel bills by an average of 25 percent in  
65 the housing units served.

- 66 • “To reduce total fossil fuel consumption across all buildings by an additional  
67 one-half percent each year, leading to a total reduction of six percent  
68 annually by 2017 and 10 percent annually by 2025.
- 69 • “To save Vermont families and businesses a total of \$1.5 billion on their fuel  
70 bills over the lifetimes of the improvements and measures installed  
71 between 2008 and 2017.
- 72 • “To increase weatherization services to low-income Vermonters by  
73 expanding the number of units weatherized or the scope of services  
74 provided, or both, as revenue becomes available in the Home  
75 Weatherization Assistance Fund.”
- 76 • Renewable energy goals ([30 VSA § 8001<sup>6</sup>](#))  
77 [The Global Warming Solutions Act<sup>7</sup>](#) (Act 153 of 2020) mandated the  
78 creation of a [Vermont Climate Action Plan \(CAP\)<sup>8</sup>](#), which was released in  
79 2021.

### 80 **C. Energy Defined**

81 Energy, as used in the 2022 CEP and this Plan, is not the same as electricity. Energy  
82 includes all forms of energy used by people for transportation, thermal (heating),  
83 and electricity. Energy can be expressed in British Thermal Units (BTUs). Charts in  
84 this Plan will be shown in BTUs, including million BTUs (MMBTUs). A BTU is a  
85 measure of the energy content in fuel and is a helpful unit of energy when  
86 comparing different energy sources.

87 **D. Key Energy Issues**

88 **Environmental Protection**

89 The consequences of our current pattern of energy use are increasingly alarming  
90 and urgent. National and international experts agree that if humanity does not  
91 immediately and dramatically reduce the use of fossil fuels, the negative  
92 consequences of climate change will alter human civilization.

93 According to the Vermont Department of Health’s [Vermont Climate and Health](#)  
94 [Profile Report](#)<sup>9</sup> (September 2016), without a sharp reduction in greenhouse gas  
95 emissions, Vermont’s climate will change substantially. By the end of the century,  
96 these changes may include:

- 97 • An increase in average annual temperatures of between 4 degrees F and 7  
98 degrees F
- 99 • Increased dangerously hot days from 5 to more than 30 per year
- 100 • Lengthened tick and mosquito activity by about 40 days
- 101 • More frequent heavy rainfall events

102 **Energy Security**

103 The TRO Region’s current dependence on fossil fuels is significant. The primary  
104 use of these fuels is for space heating and transportation. In the TRO Region,  
105 roughly 13,000 households rely on oil for heating, which means a substantial  
106 portion of the Region is subject to oil price and availability fluctuations.

107 Where the Region’s electricity is generated is also a concern. Vermont currently  
108 obtains much of its electricity from hydroelectric facilities located out of state,  
109 primarily in Quebec. While these sources of electricity currently provide the  
110 Region with low-cost, renewable generation, the prospective construction of high-

111 capacity transmission lines from Quebec to southern New England may create  
112 increased competition for electricity between Vermont and other New England  
113 states that are seeking electricity from renewable sources. Reducing or  
114 maintaining current levels of the Region’s reliance on imported energy will make  
115 the State and Region more energy secure, especially in a future where electricity  
116 demand is anticipated to increase as the use of fossil fuels decreases.

117 Electricity provides the most viable path toward meeting the State’s energy goals  
118 in several key areas. Electrification of passenger vehicles will dramatically reduce  
119 energy use in the transportation sector through use of more efficient vehicles.  
120 Similarly, the easiest transformation in space heating of existing residential  
121 buildings is to weatherize the structure and install highly efficient electric cold  
122 climate heat pumps and/or modern wood heat systems.

### 123 **Energy Justice**

124 Equity is of critical importance in developing any public policy related to energy.  
125 Everyone in our society depends on energy for their daily life and livelihood, but  
126 the costs—both financial and environmental--of providing this energy are not  
127 distributed equitably. Historically, people of color and poor people have suffered  
128 disproportionately from adverse health impacts caused by energy production and  
129 from the effects of climate change. The concept of [‘energy justice’](#) holds that  
130 these marginalized populations should be among the first to benefit from the  
131 transition to clean energy.

132 In Vermont, and in the TRO Region, a ‘just transition’ to clean energy will ensure  
133 that poor and other marginalized people have equitable access to home  
134 weatherization and green technologies such as solar power, electric vehicles, and

135 heat pumps. Such technologies often have high up-front installation costs, but  
136 come with lower operations and maintenance costs. TRORC has an important role  
137 to play in bridging the gap between local communities and the federal, state, and  
138 utility incentives that can help reduce installation costs and allow marginalized  
139 people to reap the full benefits of green technology.

140 Undergirding this conversation about energy justice is the importance of keeping  
141 the cost of electricity affordable for all, even as demand soars due to the  
142 electrification of the thermal and transportation sectors. However, it is also  
143 important to note that electrification will reduce the exposure of the Region’s  
144 households and businesses to the volatile cost of fossil fuels. Any increase in the  
145 retail cost of electricity is subject to an intensive state regulatory process, while  
146 the cost of fossil fuels such as gasoline, home heating oil, and propane follow the  
147 fluctuations of the global market on a daily basis.

#### 148 **Economic Needs and Opportunities**

149 Vermont spends nearly \$2.4 billion and the TRO Region approximately \$160  
150 million annually on energy, with the vast majority of those dollars exported out of  
151 state as we buy gas and oil. This Plan, like Vermont’s 2022 CEP, states that overall  
152 energy consumption will need to decline by about one-half by 2050 to meet our  
153 energy goals. That reduction can be accomplished through changes in land use  
154 patterns and the transportation system (by reducing the need for driving and by  
155 introducing more energy-efficient vehicle technologies); through extensive  
156 building upgrades and weatherization; and with energy conservation by means of  
157 more efficient appliances and devices, avoiding peak use, and by electricity  
158 storage technologies.

159 These improvements will also keep more of the money we spend on energy in the  
160 Region, so that millions of dollars will be retained to circulate in local economies,  
161 supporting employment and social services, and improving the quality of life of  
162 our communities. The changes needed to reduce our energy demand and to  
163 produce local renewable energy offer a wide array of business and employment  
164 opportunities. Clean energy jobs include those in renewable energy, energy  
165 storage, energy efficiency, and advanced transportation and heating.

### 166 **E. Regional Energy Supply, Demand, and End Use**

167 Energy use in Vermont is dominated by the transportation (38%) and residential  
168 (28.0%) sectors. According to LEAP modeling, in order to meet CAP mitigation  
169 goals, the **TRO Region will have to reduce energy consumption nearly 50 percent**  
170 **— from 11,000,000 MMBTUs to 5,586,000 MMBTUs by 2050.**

171 The State’s goal of meeting 90 percent of energy needs from renewable sources  
172 by 2050 represents a substantial shift from our current energy portfolio. While,  
173 according to PSD, 65 percent of Vermont’s grid electricity came from renewable  
174 sources and 21 percent from nuclear (which is carbon-free) in 2022, electricity is  
175 just one sector of energy consumption. Most energy used in the Region today still  
176 comes from fossil fuels burned for transportation and heat. The Region does get  
177 some thermal energy from wood as well. To reach the State’s renewable energy  
178 generation targets, more renewable generation will need to be developed, and we  
179 believe most of this will be from solar.

180 The growth of the renewable energy generation industry in Vermont over the last  
181 several years has been substantial. According to PSD data, Vermont has an  
182 installed capacity of 511 MW of solar power—57 MW in the TRO Region. The

183 proliferation of commercial wind energy generation in Vermont has been  
184 decidedly slower, primarily due to the costs of development and the complicated  
185 permitting requirements. Vermont has an installed capacity of roughly 151 MW of  
186 wind power and 575 MW of hydro power.<sup>7</sup> Hydro development has dropped off  
187 significantly since the early 1990s, due to a number of factors including the loss of  
188 economic incentives and stricter permitting requirements.<sup>8</sup>

## 189 **F. Electricity Conservation and Renewable Generation**

190 PSD-provided data modeling shows that a nearly 50 percent decrease in overall  
191 energy use in the TRO Region is required to meet the CEP’s goals for 2050. At the  
192 same time, we must decarbonize the thermal and transportation sectors—mainly  
193 by converting to new electric technologies, such as cold climate heat pumps and  
194 electric vehicles. This means that electricity consumption is expected to increase  
195 significantly, even as our overall energy use declines. This fundamental change in  
196 the type of energy we use will require substantial changes at the utility scale.

197 Energy demand management is the lowest-cost option to help meet expected  
198 demand. Installing energy -efficient equipment and improving building shells to  
199 reduce the need for space heating is essential to reducing our overall energy use.  
200 Proper load management can reduce demand during peak hours. Demand  
201 response techniques include time of use rates, smart rates, and energy use  
202 feedback. For example, water heaters can be timed to use power in the middle of  
203 the day when electric loads are less. Utilities can install advanced meter  
204 infrastructure (AMI), which increases system reliability and load management  
205 capabilities with two-way communications technology. AMI includes smart meters  
206 to enable utilities and customers to track and manage the flow of energy more

207 efficiently, curb peak demand, lower energy bills, and integrate renewable energy  
208 sources and storage to the grid. AMI data and smart meter technology allow  
209 utilities to implement smart rates, which can vary the price of electricity to  
210 accurately reflect the cost of electricity: lower rates for low demand and higher  
211 rates during peak demand. This incentivizes lower electric use during peak times.  
212 But even with fully implemented demand-side management, fuel-switching to  
213 electricity will require new sources of renewable energy.

214 Our existing electric grid is not yet fully capable of allowing the placement of small  
215 renewable energy generation facilities in every community in our Region.

216 Currently in the GMP region, for example, parts of Hartford and Hartland have  
217 poor circuit ratings, while the Washington Electric territory has no remaining  
218 capacity. In addition, energy supply (generation) and loads (end uses) must be  
219 kept in balance, even as customers change their end uses or renewable energy  
220 facilities respond to changes in generation. As the Region transitions to 90 percent  
221 renewable energy by 2050 (with much of it produced in state), power companies  
222 and VELCO will need to increase the pace of system-wide upgrades. This will  
223 include line upgrades and, once the technology becomes readily available, the  
224 provision of storage technologies such as Tesla’s Powerwall battery system.  
225 Electrical storage can closely align customer loads with periods of lower electric  
226 demand, store solar electricity to use during peaks, or provide some backup  
227 during power outages.

228 Most electric utilities in the U.S. are required to meet state-mandated renewable  
229 energy requirements called [Renewable Portfolio Standards<sup>10</sup>](#). Vermont’s  
230 Renewable Portfolio Standard policy is called the [Renewable Energy Standard, or](#)

231 [RES<sup>11</sup>](#). Because utilities constantly import and export power in order to meet  
232 demand, keeping track of how much renewable energy each utility uses is not  
233 easy to do. A clear system of accounting is needed to ensure that renewables are  
234 not being claimed by multiple utilities. That system of accounting is called  
235 [Renewable Energy Certificates, or RECs<sup>12</sup>](#). RECs are created for every unit of  
236 renewable energy fed into the grid. Once created, RECs can then be purchased  
237 and traded among utilities; this way, utilities can accrue enough RECs to  
238 demonstrate compliance with their respective states’ Renewable Portfolio  
239 Standards, even if they did not actually purchase the renewable power those RECs  
240 are associated with. RECs are not a perfect system, but they help regulators track  
241 renewable generation while accounting for the way electricity wholesale markets  
242 function—across multiple state jurisdictions and highly dependent on what type  
243 of power is available for import when it’s needed.

244 In Vermont, many developers utilize the sale of RECs to help fund the construction  
245 of a project. The challenge is that RECs are often sold to utilities outside of  
246 Vermont. The energy generated by a renewable energy generation facility that has  
247 sold its RECs out of state does not count toward the state’s energy goals. But it  
248 does count toward local and regional targets. Changes in legislation have made it  
249 possible to ‘retire’ RECs in state, thus allowing us to further increase our  
250 renewable energy portfolio. Efforts to increase that cap or encourage their  
251 retirement in state should continue in order to ensure that the goals of the CEP  
252 are reached.

253 **Goals, Policies, and Recommendations: Electricity Conservation and**  
254 **Renewable Generation**  
255 **Goals**

- 256 1. Twenty-five percent of overall energy needs comes from renewables by  
257 2025, 40 percent by 2035, and 90 percent by 2050.
- 258 2. The amount of renewable electricity generated in the TRO Region  
259 increases from 2022 levels by 86,740 MWh by 2050.

260 **Policies**

- 261 1. TRORC supports using demand-side management measures, such as  
262 Flexible Load Management (FLM), to manage the expected electric  
263 energy demand increase in the TRO Region.
- 264 2. TRORC supports Efficiency Vermont and other incentive programs to  
265 reduce electric energy use and encourage the use of devices and  
266 equipment that perform work using less energy input than otherwise  
267 necessary, such as [Energy Star or CEE2, CEE<sup>13</sup>](#) or advanced appliances.
- 268 3. TRORC encourages the deployment of grid resilience measures such as  
269 energy storage, microgrids, and grid hardening that lead to improved  
270 reliability of electric service for the region’s residents.
- 271 4. TRORC will promote a wide variety of renewable energy generation  
272 types, including adding photovoltaic solar installations, wind turbines,  
273 and [run-of-the-river hydroelectric<sup>14</sup>](#) facilities, optimizing existing  
274 hydroelectric dams, promoting sustainable use of bio-digesters, and  
275 encouraging passive solar building designs.

276 **Recommendations**

- 277 1. TRORC will advocate for the continuation of policies that lead to the  
278 retirement of renewable energy credits in state.

- 279        2.        TRORC will help interested towns meet the standards set forth in [Act](#)  
280                    [174<sup>15</sup>](#) for enhanced energy planning so that local preferences receive  
281                    “substantial deference” in the Public Utility Commission’s [Section 248<sup>16</sup>](#)  
282                    proceedings. “Substantial deference” is a term used in statute but has  
283                    not been further defined in proceedings or litigation.
- 284        3.        PSD and TRORC should support and provide outreach for Energy  
285                    Action Network’s Community Energy Dashboard and Efficiency  
286                    Vermont’s customer engagement web portal and home energy reports.
- 287        4.        TRORC and PSD should support efforts to develop programs that  
288                    encourage energy conservation through behavioral change by  
289                    advocating for [smart grid technology<sup>17</sup>](#) and a pilot of advanced meter  
290                    infrastructure and time-of-use rates in the Region.
- 291        5.        TRORC will maintain an enhanced energy compliant Regional Plan in  
292                    order to play a stronger regional role in the Public Utilities Commission  
293                    (PUC) permitting process.
- 294        6.        TRORC will work to expand its shared energy coordinator (IREC)  
295                    program and encourage other RPCs to duplicate the model around the  
296                    state.

## 297    **F. Transportation and Land Use**

298    This section addresses the intersection of transportation, energy, and land use.  
299    The [Land Use<sup>18</sup>](#) and [Transportation<sup>19</sup>](#) chapters in this Regional Plan complement  
300    this section and have additional relevant policies and actions.

301    Vermont uses more energy for transportation than for any other sector: 38  
302    percent of the total energy consumed in Vermont. To reach the 2022 CEP goals,

303 Vermonters will need to switch from petroleum powered vehicles to electric  
304 vehicles It is also important to recognize that land use choices are inextricably  
305 linked to our transportation system. Vermonters travel far from their homes to  
306 jobs, services, and shopping. The 2022 CEP seeks to reduce transportation  
307 greenhouse gas emissions 40% below 1990 levels by 2040 and 80% below 1990  
308 levels by 2050.

309 Vermont’s land use and transportation patterns are key reasons why  
310 transportation uses the largest portion of our energy. Where we work, go to  
311 school, shop, utilize services, and recreate is often not close to where we live.

312 Much of Vermont’s appeal to homeowners is the ability to own a house in the  
313 country. While many communities have small villages or downtowns, residential  
314 development in our towns is mostly located outside of these areas on rural roads.  
315 The choice to live in a rural setting leads to longer commutes for work, shopping,  
316 and services.

317 This dispersed pattern of development is currently furthered by the way we  
318 regulate development locally. Many communities allow residential development  
319 in much of their towns, and often at village-scale densities (one to two acre) in  
320 rural areas. In effect, this does not direct most growth to core areas, but spreads it  
321 throughout town. If this pattern of development persists, these communities will  
322 need to improve roads in rural areas to serve new development, resulting in  
323 undue costs to taxpayers for road maintenance, increasing vehicle miles traveled  
324 (VMT), and making it more difficult to use public transit.

325 Another challenge for Vermont’s transportation patterns is the lack of available  
326 public transit. The Regional Transit Network map in Figure XX illustrates that

327 access to public transit is currently difficult or nonexistent in many parts of our  
328 Region. Public transit provides less than 1 percent of the transportation in our  
329 Region. The rural character of the Region presents challenges for a traditional  
330 public transportation system. Long distances between homes and employment  
331 centers strain existing commuter bus routes, while the need for transportation in  
332 low population density areas presents a uniquely rural challenge to the system.  
333 However, transit systems could still replace many single-occupant vehicle (SOV)  
334 trips at a significant cost savings to drivers. The main impediment to greater  
335 transit is not that it costs more than cars; it is simply that we like to own cars.

336 The Region does have several public transportation services which are vital to our  
337 Region’s population, and elderly and disabled transportation services give  
338 alternatives to people who wish to live independently but who are unable to drive  
339 themselves.

340 In areas where local transit services are available, other challenges exist.  
341 Commuter bus routes that stop at regular intervals along their routes extend the  
342 length of the trip, making it quicker for someone with a car to drive themselves  
343 instead. The impact of regular stops can also make it challenging to time arrivals  
344 and departures in an economic center with hours of employment.

345 Developments that occur in areas that are either right on or nearby a public  
346 transit route are sometimes planned without considering public transit. If not  
347 considered during the planning stage, it is difficult to integrate public transit  
348 services into completed site plans. In addition, the location of residential  
349 subdivisions away from transit lines limits public access. Diverting an existing

350 route to a new location is expensive and can have negative impacts on existing  
351 services.

352 Regular fixed route transit services, such as those in Hartford and Norwich, could  
353 increase ridership by adding additional buses and increasing the frequency of  
354 service. But to do so requires additional buses and drivers, both of which require  
355 significant funding. Funding also limits the hours of operation. Fixed route transit  
356 services in our Region are currently limited to early morning through evening,  
357 which means potential riders who work shifts outside of the traditional 9-5 model  
358 cannot take advantage of most public transit.

359 Finally, there are perceptions that public transit is a service geared toward low-  
360 income citizens. While it is true that these demographic groups benefit from  
361 public transit, public transportation services are available and useful to everyone.

362 A significant portion of commuters drive alone to get to work. This could be  
363 lessened with more carpooling, but Vermont’s commuter lots are currently  
364 insufficient. While the State has increased the number of park and ride spaces  
365 significantly in recent years, expansion and facility upgrades are still needed. For  
366 example, many existing park and ride areas are not designed or sized to  
367 accommodate public transit services (allowing for bus circulation and efficient  
368 transfer of passengers). Furthermore, a new lot is needed at Exit #1 on I-89, and  
369 no state park and rides in the region provide EV charging above level 1 (equivalent  
370 to a 110-volt wall outlet). This is due to restrictions on for-profit vendors at  
371 facilities that have received federal funds. TRORC encourages VTRANS to work  
372 with its federal partners on reforms that will allow for EV chargers throughout the  
373 state park and ride system.

374 The lack of EV charging station infrastructure is an impediment to reaching the  
375 State’s ambitious EV goals. While numerous models of EVs now have ranges of  
376 250 miles or more, ‘range anxiety’ remains a major factor in the decision to  
377 purchase an EV. To support the State’s EV adoption goals, EV charging stations will  
378 need to become ubiquitous. While, according to the [Alternative Fuels Data](#)  
379 [Center](#)<sup>20</sup>, 50 publicly-accessible level 2 (240-volt) charging ports and 16 level 3 DC  
380 fast charging (or DCFC) ports are now available throughout the TRO Region, we  
381 have still not achieved this ubiquitous status.

382 **Transportation and Land Use Strategies**

383 To achieve the CEP’s goals, transportation energy use must be reduced by  
384 embracing smart growth that directs development into existing centers, providing  
385 cost savings for households and municipalities while creating vibrant communities  
386 and taking pressure off our natural resources.

387 Development that is more effectively directed within and adjacent to historic  
388 downtowns, villages, and neighborhoods will reduce the need for motorized  
389 transportation and make better use of transit. In 2006, via Act 183, Vermont  
390 codified its own detailed guiding principles for local and regional land use  
391 decisions based upon smart growth principles. Although communities are not  
392 required to plan, those that do are encouraged to uphold planning and  
393 development goals that reinforce smart growth principles, such as [Complete](#)  
394 [Streets](#)<sup>21</sup>. Complete Streets focus on multi-modal transportation, public transit,  
395 and pedestrian travel.

396 Encouraging economic development initiatives that enable individuals to work in  
397 their home communities, such as “maker” or “coworking” spaces and expanded

398 high-speed Internet will reduce VMT. Likewise, communities can support infill  
399 development and concentrated commercial and institutional activities in our  
400 villages and downtowns.

## 401 **Goals, Policies, and Recommendations: Transportation and Land Use**

### 402 **Goals**

- 403 1. Regionwide vehicles miles traveled (VMT) per capita is reduced to  
404 9,500. (In 2019, the [statewide VMT per capita<sup>22</sup>](#) was 11,772).
- 405 2. The number of single-occupant vehicle trips is reduced by 5 percent  
406 from 2024 figures by 2035 through remote work, carpooling, and public  
407 transit.
- 408 3. The percentage of light-duty vehicles registered in the region that are  
409 electric is increased to 5 percent by 2025, 57 percent by 2035, and 100  
410 percent by 2050.
- 411 4. Usage of state and municipal park and rides triples by 2040.
- 412 5. By 2040, public transit ridership has increased by 100 percent  
413 compared to pre-pandemic levels, to 2 million trips annually. (In 2019,  
414 [Tri-Valley Transit<sup>23</sup>](#) and [Advance Transit<sup>24</sup>](#) reported a combined  
415 1,040,776 unlinked passenger rail trips.)

### 416 **Policies**

- 417 1.  
418 Land use policy and regulation shall be designed to encourage use of  
419 public transit, cycling, and walking for daily trips.

- 420        2.        All new residential, commercial, and industrial developments subject to  
421                    Act 250 that provide five or more off-street parking spaces shall install  
422                    level 2 (240V) EV chargers at a rate of one port for every five employees  
423                    or residential units, as applicable. Developments with fewer than five  
424                    employees or residential units must install at least one port. If the  
425                    developer can demonstrate that installing on-site charging stations  
426                    would be unduly onerous due to poor utility access or other site  
427                    constraints, they may meet the requirements of this policy by installing  
428                    the requisite number of chargers at a comparable in-region location.  
429                    Nothing in this policy shall prohibit the developer from charging user  
430                    fees at charging stations.
- 431        3.        The development of new fossil fuel service stations is strongly  
432                    discouraged in the TRO region. New service stations that provide  
433                    alternative transportation fuels, such as electric vehicle charging and/or  
434                    hydrogen, and the conversion of existing service stations to provide  
435                    these fuels, is encouraged.
- 436        4.        TRORC supports efforts to provide the Region with opportunities to  
437                    work closer to home and to require public transit opportunities for  
438                    large scale development, likely to result in conservation of energy.
- 439        5.        All developments subject to Act 250 must demonstrate that they have  
440                    consulted with transit providers about reasonable accommodation of  
441                    public transit. This consultation shall include the appropriateness of a  
442                    dedicated transit stop and covered transit shelter.
- 443        6.        TRORC will support new bike and pedestrian projects in the Region.

- 444 7. The inclusion of bike racks and e-bike charging stations at new  
445 developments, particularly in the region’s village centers and  
446 downtowns, is encouraged.
- 447 8. TRORC supports programs and planning initiatives that will reduce  
448 single-occupant trips throughout the Region, including Go Vermont and  
449 CarShare Vermont.

450 **Recommendations**

- 451 1. TRORC will encourage communities to develop bylaws that allow for  
452 the development of co-working spaces as a way to reduce VMT.
- 453 2. TRORC should work with large employers to create incentives for  
454 carpooling, cycling, public transportation use, and telecommuting.
- 455 3. TRORC will work with groups such as the Vermont Bicycle and  
456 Pedestrian Coalition (VBPC), Local Motion, Green Mountain Bicycle  
457 Club, and towns to encourage safe bicycling as a transportation  
458 alternative in the Region.
- 459 4. TRORC will work with VTrans and local transit providers to ensure a  
460 seamless regional transit system and to explore possibilities for  
461 additional buses or routes.
- 462 5. TRORC will work with VTrans and other relevant partners to investigate  
463 the feasibility of increasing the frequency of passenger rail trips along  
464 the Amtrak Vermonter corridor (St. Albans to Brattleboro with service  
465 to New York City and Washington, D.C.).

466 6. TRORC will promote and share information provided by Drive Electric  
467 Vermont, including their guide to electric vehicle incentives.

468 7. TRORC should support efforts to switch municipal light- and medium-  
469 duty vehicles to electric and heavy -duty vehicles to alternative fuels,  
470 which may include electric and/or combustible fuels that have lower  
471 lifecycle emissions than fossil fuels, such as biodiesel or hydrogen.

## 472 **G. Thermal Energy**

473 According to the 2022 Comprehensive Energy Plan, thermal and process energy  
474 use accounts for 31 percent of all energy use in Vermont. The reliance on heating  
475 from non-renewable sources (fuel oil, natural gas, and propane) creates a  
476 challenge for Vermonters that extends beyond energy issues. Low-income  
477 residents may find it challenging to stay comfortable in their own homes due to  
478 fuel costs. In 2010, Vermont ranked 44th out of 50 states for energy affordability.<sup>10</sup>  
479 In 2010, low-income Vermonters spent an average of \$1,870 more per family, per  
480 year, on energy bills than is considered affordable.

481 In addition to thermal efficiency improvements, the 2022 CEP is seeking a  
482 statewide change in how we heat our buildings. This approach will focus primarily  
483 on the installation of [cold climate air-source heat pumps<sup>25</sup>](#), which consume far less  
484 energy than electric resistance, propane, or oil heating systems. In order to  
485 contribute to the State’s heat pump installation target (411,659 installed  
486 statewide by 2035), a total of over 30,604 will need to be installed in the TRO  
487 Region by 2035. In some cases, cold climate air-source heat pumps may be  
488 inadequate to meet a building’s heating load during extreme sub-zero days (-20  
489 degrees F). For example, air-source heat pumps for large commercial buildings

490 may require substantial grid upgrades to meet demand on severely cold days, so  
491 secondary heating systems may still be required. It is always best to follow the  
492 advice of licensed, reputable professionals when installing new equipment in a  
493 building. In general, though, cold climate air-source heat pumps are effective,  
494 cheaper to operate than fossil fuel boilers, and will fully meet the needs of  
495 Vermont households during 99% of the year. Because of this, TRORC expects cold-  
496 climate heat pumps to become the most common primary heating source in  
497 Vermont.

498 [Geothermal or “ground source” heat pumps<sup>26</sup>](#) are also a tremendous opportunity.  
499 These systems are substantially more expensive to install than air-source heat  
500 pumps but are even more efficient. They are better suited to new development  
501 than retrofitting into existing buildings due to the technology’s requirements.  
502 Where such buildings are located next to a concentration of other buildings, the  
503 CEP has also recognized the potential for district heating and/or combined heat  
504 and power, which are systems for producing heat in a centralized location and  
505 distributing it throughout the local area.

506 New buildings will need to be built to a significantly higher level of performance  
507 than is required by the State’s current [Residential and Commercial Building Energy  
508 Standards<sup>27</sup>](#). Net-zero buildings are highly efficient and save 30 to 45 percent on  
509 overall energy costs in comparison with standard buildings. [Efficiency Vermont’s  
510 2015 Net Zero Energy Feasibility Study<sup>28</sup>](#) determined that new construction of  
511 residential and office net-zero energy buildings is a cost-effective investment.  
512 These buildings cost less to own and operate than code buildings from the first  
513 year into the long term.

514 In Orange and Windsor Counties, 47 percent of homes were built before 1970.  
515 These older homes were constructed before high energy costs made energy  
516 conservation a priority in the built environment. As a result, a substantial number  
517 of our homes utilize wasteful amounts of energy and are expensive to maintain.

518 To achieve [the State’s building efficiency goals<sup>29</sup>](#), approximately 15,697 of the  
519 Region’s housing units will need to be weatherized by 2035.

520 The upfront cost of energy efficiency improvements and building-scale renewable  
521 energy generation remains a challenge. Despite the demonstrated long-term  
522 savings benefits, the capital needed to significantly reduce energy consumption  
523 and add renewables is a significant barrier to implementation. When surveyed as  
524 part of the East Central Vermont Sustainability Project, 39.5 percent of those who  
525 responded indicated that they could not afford to make their home more energy  
526 efficient. Another 33.8 percent were unable to make energy efficiency  
527 improvements because they rent instead of own. Cost is an issue for all  
528 homeowners, but especially for low- and moderate-income homeowners.

529 With upfront capital cost being a significant barrier to the implementation of  
530 thermal efficiency and renewable energy improvements, it is essential that  
531 programs that provide funding and financing grow. In particular, programs  
532 providing assistance to middle- and low-income households must increase in  
533 funding. A list of current financing programs can be found on [Efficiency Vermont’s  
534 website<sup>30</sup>](#).

535 These financing programs offer key features such as great interest rates, flexible  
536 terms, and ease of application. The loans can also be combined with Efficiency  
537 Vermont incentives.

538 While fuel assistance programs are essential, increased funding to Vermont's  
539 [Weatherization Assistance Program \(WAP\)](#)<sup>31</sup> is needed. In addition, fuel distributors  
540 must be encouraged to become energy service providers, expanding what they  
541 offer so that more homes can be weatherized and increase their energy efficiency.  
542 Some form of this model is likely to be implemented under [Vermont's Clean Heat](#)  
543 [Standard](#)<sup>32</sup>.

544 TRORC can support these programs and initiatives by communicating directly with  
545 energy providers, state agencies, and the legislature. We can provide input on  
546 state level initiatives, and we can, if the opportunity presents itself, pursue federal  
547 funding to support these programs within our Region.

548 At the commercial and public sector levels, capital and operating budgets are  
549 often set independently of each other, resulting in lack of awareness of financial  
550 incentives for energy improvements.

551 Vermont's system of building codes and energy efficiency standards enforcement  
552 is somewhat problematic. New Residential Building Energy Standards (RBES) and  
553 Commercial Building Energy Standards (CBES) will come into effect on July 1<sup>st</sup>,  
554 2024, but these rule changes do nothing to solve the Standards' weak  
555 enforcement mechanisms. Currently there are no state permits or code officials  
556 for energy efficiency. Energy efficiency is self-certified by the building contractor,  
557 with a requirement that a completed certificate be submitted to the municipality.  
558 However, some communities may be unaware of this requirement and how to  
559 track the submission of certificates. Towns with local code officials may enforce  
560 energy efficiency codes and towns with certificate of occupancy (COO)  
561 requirements must receive an energy code certificate before issuing the COO.

562 Nearly two-thirds of TRORC’s communities (19) have zoning bylaws, but less than  
563 half (9) require a COO.

564 Concurrently, the State needs to ratchet up the standards set forth in the RBES and  
565 CBES. Standards for achieving net-zero design must be incorporated. Some  
566 regional builders such as [Prudent Living’s Southscape community](#)<sup>33</sup> and [VERMOD](#)<sup>34</sup>  
567 are currently constructing net-zero possible homes.

568

569 If adequate funding was available, TRORC could develop additional staff positions  
570 that would focus specifically on energy assistance, education, and outreach.

571 Without duplicating existing services, such as those that Efficiency Vermont, Vital  
572 Communities, Energy Action Network, and GMP offer, a TRORC staffer could act as  
573 a clearinghouse of energy information for our communities Acting as a bridge  
574 between state-level service providers, contractors, and municipal organizations,  
575 TRORC would effectively move the Region toward meeting the CEPs goals relating  
576 to thermal efficiency. These services are already offered through our shared  
577 energy coordinator program, but only to member towns that buy into the  
578 program.

## 579 **Goals, Policies, and Recommendations: Thermal Energy**

### 580 **Goals**

- 581 1. At least 63 percent of the Region’s housing stock is weatherized by  
582 2035.
- 583 2. By 2025, 30 percent of new buildings are built to [zero energy ready](#)  
584 standards and 100 percent by 2030.
- 585 3. 26,982 residential cold climate heat pumps are installed by 2035 .

586 4. 50% of new residential, commercial, and industrial developments of  
587 20,000 sq ft and above will use geothermal heating systems by 2035.

588 **Policies**

589 1. TRORC supports state efforts to provide additional funding for  
590 weatherization improvements, especially for low- and moderate-  
591 income populations.

592 2. New residential, commercial, and industrial developments subject to  
593 Act 250 shall not use fossil fuel combustion as a primary heating  
594 source.

595 3. Developers of new residential, commercial, and industrial projects  
596 subject to Act 250 shall demonstrate due consideration of ground-  
597 source (geothermal) heat pumps as a method of heating. Developers  
598 must also demonstrate due consideration of heat recovery  
599 technologies such as [Energy Recovery Ventilators \(ERVs\)](#)<sup>35</sup> and heat  
600 recovery from large-scale refrigeration and/or industrial processes as  
601 applicable.

602 4. TRORC supports net-zero energy construction throughout the Region.

603 5. TRORC supports the creation of enforcement mechanisms to enhance  
604 compliance with Vermont’s Residential and Commercial Building  
605 Energy Standards (RBES and CBES).

606 **Recommendations**

- 607 1. TRORC should work with local energy committees, planning  
608 commissions, and developers in identifying potential users of district  
609 heating, [Thermal Energy Networks \(TENs\)](#)<sup>36</sup>, and combined heat and  
610 power systems—schools, college campuses, apartment complexes,  
611 shopping centers, industrial parks, and village centers—and incorporate  
612 this information into local plans.
- 613 2. TRORC will distribute information regarding the available financing  
614 mechanisms, rebates, and incentives for weatherization assistance,  
615 electrification, and fuel-switching.
- 616 3. TRORC should work to expand its shared energy coordinator program  
617 and support other RPCs in replicating the program in their own regions.
- 618 4. TRORC and local energy committees should work with owners of rental  
619 housing to educate them on the financial benefits of weatherization  
620 investments and should connect owners with contractors to complete  
621 weatherization projects.
- 622
- 623 5. TRORC and its towns should support programs and initiatives that  
624 encourage the development of small homes (less than 1,000 square  
625 feet) as a means of reducing energy use.
- 626 6. TRORC will provide outreach to towns and contractors on the use and  
627 enforcement of residential and commercial building energy standards  
628 for all new construction.

- 629 7. TRORC will encourage communities that have zoning to include a  
630 certificate of occupancy when they revise their regulations if they do  
631 not already have one.
- 632 8. TRORC should provide outreach to communities with a COO to ensure  
633 that they are tracking submissions of the RBES certificate.
- 634 9. TRORC will partner with Efficiency Vermont, Green Mountain Power,  
635 HVAC contractors, and others to promote cold climate heat pumps.
- 636
- 637 10. TRORC will work to maintain forest health as a prerequisite to a  
638 sustainable wood energy fuel supply and carbon sequestration.
- 639 11. TRORC can assist communities with continued outreach regarding code  
640 compliance. We can also support the PSD as they move forward on  
641 adoption of more effective energy efficiency codes.
- 642 12. The State should support woodstove change-out programs to lower  
643 heat cost and reduce particulate emissions.

## 644 **H. Utility-Scale Renewable Energy Facility Siting**

### 645 **Regulation of Generation Facilities Siting in Vermont**

646 Vermont’s [Public Utility Commission \(PUC\)](#)<sup>37</sup> is the state’s principal authority for  
647 granting permits to new grid-connected energy generation facilities, through a  
648 permitting review process known as “[Section 248](#)<sup>38</sup>.” [Under Act 174 of 2016](#)<sup>39</sup>, the  
649 PUC is obligated to give “substantial deference” to the portions of regional plans  
650 addressing energy development, if the plan has been submitted to and approved  
651 in advance by the Public Service Department (PSD). In addition, the PUC is  
652 obligated to give “substantial deference” to the energy chapters of town plans, if  
653 the plans have been reviewed and approved by the relevant regional planning

654 commission. Essentially, by putting in the effort to gain this “enhanced energy  
655 plan” status, towns can ensure that their preferences on siting are given greater  
656 weight in the PUC permitting process when new generation facilities are proposed  
657 in their town.

### 658 **Hierarchy of Suitability**

659 All lands within the TRO Region have been analyzed on a rough scale using map  
660 data supplied by PSD. The maps were made by first identifying areas that have raw  
661 potential for certain types of power production based upon certain qualities of  
662 the landscape. For example, only certain ridgelines are believed to have enough  
663 wind potential to justify building a wind turbine, and, usually, only lands with good  
664 exposure and gentle slopes make sense for solar development. (It should be noted  
665 that the maps do not take into account whether lands are clear or forested.)  
666 Preferred locations come in two forms: state preferred areas and locations  
667 specifically identified by the town.

### 668 **Raw Generation Potential Locations**

669 TRORC has generated map data that indicates where raw energy generation  
670 potential exists for solar, wind, and hydro. This does not mean that they should go  
671 there, only that these are the areas where solar, wind, and hydro resources are  
672 present. This data should be the **starting point** for the local identification of where  
673 renewable energy generation should be located within your community.

674 This type of area is shown on the solar and wind maps and includes solar  
675 generation potential based on solar radiation, slope, and direction, as well as wind  
676 generation potential based on topography. Solar potential does not distinguish  
677 between open or forested areas.

678 **Solar Siting**

679 Sites with raw solar potential are flat to gently sloping and face east, south, or  
680 west. Significant growth in the solar energy production sector in Vermont has  
681 sometimes led to a backlash against proposed facilities. The primary concern is  
682 one of aesthetics. For some, it is challenging to reconcile the appearance of a solar  
683 farm with the traditional rural character of the Region. Residents may also  
684 perceive a loss of property value when a solar facility locates near their home,  
685 although there is no hard data available to support this perception.

686 Also of concern are the natural resource implications of solar farms. Often these  
687 facilities are proposed in areas that are being used for agricultural purposes on  
688 valuable prime agricultural soils. While it is possible to conduct some forms of  
689 farming on land occupied by a solar system (such as small ruminant grazing), most  
690 agricultural uses become impractical, though the underlying land remains intact  
691 for future cultivation. For those farmers that lease land for feed production, the  
692 removal of actively used farmland from the pool of available land has the  
693 potential to negatively impact their operation. On the other hand, solar  
694 generation on marginal lands may provide farming with needed income.

695 Ground-mounted solar arrays in areas served by sewer and water are not the  
696 highest and best use of this valuable space. Solar arrays in forests do not make  
697 sense as they require clearing large amounts of trees that sequester carbon.

698 **Wind Siting**

699 Only certain ridges are tall enough and big enough to have raw wind potential.  
700 Wind energy generation, although not as prevalent as solar, also has opposition  
701 due to aesthetic and noise impacts. Because these facilities must locate on

702 ridgelines to maximize production, they are visible from a much greater distance  
703 than solar. Additionally, residents neighboring a wind facility may experience  
704 negative effects from the noise and flicker of the spinning turbines.<sup>24</sup>

705 Large scale wind energy facilities can have environmental impacts as well. Much of  
706 the land on our ridges is undeveloped, making it prime wildlife habitat. The  
707 installation of wind energy generation facilities and the infrastructure needed to  
708 maintain them (primarily roads), leads to the fragmentation of continuous blocks  
709 of forestland, which can disrupt migration patterns for wildlife.

### 710 **Hydro Siting**

711 Not surprisingly, sites with hydro potential are along rivers with steep drops. The  
712 development of new hydroelectric projects is challenging. All new hydro projects  
713 that are grid-connected must seek permitting from the federal government, which  
714 is time consuming and expensive. Any development in our waterways requires a  
715 strict analysis of potential environmental impacts.

### 716 **Unsuitable (Prohibited Locations)**

717 The Regional Plan identifies some areas as poor locations for most forms of  
718 development due to their natural or scenic value or to protect our citizens from  
719 potential natural disasters. These areas have already been removed from  
720 consideration and are not shown in the constraint or prime areas on the maps.  
721 The policies displayed in this section state the unsuitable areas in the Region.

### 722 **Constraints**

723 There are many areas that have the potential for renewable energy generation but  
724 include known or possible constraints that may make these locations less  
725 desirable. **Constraint** areas are neither preferred nor unsuitable; **they simply**

726 **identify potential issues for siting energy generation facilities.** Development in  
727 these areas will require more detailed mapping at the site level as well as an  
728 evaluation of the impacts on the particular resources present. State supplied map  
729 data used in this Plan has “known” constraint areas removed and therefore these  
730 do not show on the maps. From a policy level this Plan makes no distinction  
731 between “known” or “possible” and simply combines both as constraints. Areas  
732 with constraints include:

- 733 • Historic districts, landmarks, sites, and structures listed, or eligible for  
734 listing, on state or national historic registers
- 735 • State or federally designated scenic byways, and municipally designated  
736 scenic roads and viewsheds
- 737 • Special flood hazard areas identified by National Flood Insurance Program  
738 maps (except as required for hydro facilities)
- 739 • Public and private drinking water supplies, including mapped source  
740 protection areas
- 741 • Primary agricultural soils mapped by the U.S. Natural Resources  
742 Conservation Service
- 743 • Agricultural Soils (VT Agriculturally Important Soil Units)
- 744 • Protected Lands (Updated 07/26/2016 – State Fee Lands and Private  
745 Conservation Lands)
- 746 • Deer Wintering Areas (as identified by ANR)
- 747 • Act 250 Agricultural Soil Mitigation areas (as Identified by ANR)
- 748 • ANR’s Vermont Conservation Design Highest Priority Forest Block Datasets

- 749 • Priority Forest Blocks – Connectivity, Interior and Physical Land Division (as  
750 identified by ANR)
- 751 • Hydric Soils (as identified by ANR)
- 752 • River Corridor Areas as identified by the Vermont Department of  
753 Environmental Conservation
- 754 • Class 2 Wetlands as indicated on Vermont State Wetlands Inventory maps  
755 or identified through site analysis
- 756 • Vernal pools (as identified by ANR or through site analysis)
- 757 • State-significant Natural Communities and habitats of rare, threatened, and  
758 endangered species

759 **Prime Areas**

760 Recognizing that there may be areas that are also well-suited to the development  
761 of renewable energy generation, the following criteria should be applied to  
762 proposals that are not in constraint areas. These areas are shown on the maps as  
763 ‘prime.’ If a proposed development does not fall under any of the constraint  
764 criteria above, but meets all of the criteria below, it shall be considered a prime  
765 area for the purposes of this Plan. Such an area:

- 766 • Must not be identified as an Unsuitable Area
- 767 • Must not be identified as a Constraint Area
- 768 • Must be located in an area that has reliable and safe access to the grid (as  
769 determined by the local power provider)

770 **Preferred Areas**

- 771 • While the development of any type of renewable energy generation facility  
772 is subject to review on a site -by -site basis, some areas are better suited

773 than others. Statewide preferred sites are identified in the [PUC's net-](#)  
774 [metering rule 5.100<sup>40</sup>](#) (page 8). These areas are typically small and are not  
775 shown on the energy siting potential maps.

776 The maps included as part of this guide were developed at the regional scale. As  
777 such, they do not include preferred locations. Communities should use their local  
778 knowledge to identify additional preferred areas. They can include preferred  
779 locations as legislated in Act 174. Other considerations when identifying preferred  
780 areas within communities include existing infrastructure. For example, an area  
781 with immediate access to three-phase power or an upland area with existing road  
782 access may be more desirable than an area without.

## 783 **Goal, Policies, and Recommendations: Utility-Scale Renewable Energy** 784 **Siting**

### 785 **Goal**

- 786 1. Carefully sited renewable energy facilities are built in the Region to  
787 meet generation goals.

### 788 **Policies**

- 789 1. TRORC supports the continued development and siting of renewable  
790 energy generation that counts toward the goals of the CEP.
- 791 2. Ground mounted solar arrays above 15kW in capacity should not be  
792 constructed in Regional Growth Areas if a reasonable alternate location  
793 is available, in order to preserve these areas for compact development.  
794 Solar arrays on structures in these areas are encouraged.
- 795 3. The following locations shall be considered regionally unsuitable for  
796 renewable energy generation facilities: floodways shown on FEMA

797 Flood Insurance Rate Maps (except as required for hydro facilities);  
798 Class 1 Wetlands as indicated on Vermont State Wetlands Inventory  
799 maps or identified through site analysis; Wilderness Areas, including  
800 National Wilderness Areas; Forest Based Resource Areas; any  
801 unsuitable areas as identified in a duly adopted municipal plan that has  
802 received a determination of energy compliance from the Department  
803 of Public Service or TRORC.

804 4. Utility-scale, ground-mounted solar facilities shall not be permitted on  
805 undeveloped lots served by sewer and water utilities.

806 5. Fencing or barriers surrounding ground-mounted solar array facilities  
807 shall be designed to allow for permeability by small wildlife according  
808 to the standards set by the Agency of Natural Resources.

809 **Recommendations**

810 1. TRORC will encourage communities and residents to identify areas with  
811 the potential for renewable energy generation.

812 2. TRORC should provide support for grid improvements that will allow  
813 improved renewable energy generation facility coverage in our Region  
814 by actively participating in the Act 250 and Section 248 review process.

815 3. TRORC encourages ground-mounted solar array facilities to follow  
816 accepted best practices for maintaining wildlife-friendly grassland  
817 habitat, [pollinator habitat<sup>41</sup>](#), or [agrivoltaics<sup>42</sup>](#) within the facility's  
818 boundaries.

819 **I. Conclusion**

820 Vermont has established ambitious but needed energy goals that will require all of  
821 us to reduce energy use and to transition to using renewable energy for our  
822 thermal, transportation, and electricity needs. This will result in a safer, cleaner,  
823 and healthier world for us and our children. This chapter should be used to guide  
824 TRORC in its development of work plans, to focus attention on key issues and  
825 opportunities, and to provide a framework to evaluate energy conservation and  
826 development projects in the Region. TRORC will fully integrate energy planning  
827 into the technical assistance it provides its member towns and continue to  
828 coordinate with the Vermont Energy Investment Corporation, the Energy Action  
829 Network, the Department of Public Service, and other state agencies and  
830 departments to update and improve energy planning as necessary. Improvements  
831 in the development and maintenance of accurate estimates of energy demand,  
832 fuel use, and renewable electricity generation will be needed to track progress  
833 toward goals and to help adjust local, regional, and statewide strategies and  
834 actions. TRORC will also remain engaged in statewide energy planning to ensure  
835 that future updates and information provided to municipalities remain current  
836 and consistent with state policies. A core message of the Energy chapter is that  
837 the quality of life and economic future of the Region is dependent on the efficient  
838 use of energy and access to a sufficient and sustainable amount of renewable  
839 energy. Planning for land use, transportation, community and economic  
840 development, and agriculture and food systems are inter-related must consider  
841 energy efficiency and the prudent development of renewable energy generation.  
842 The TRORC Energy chapter provides a basis for this comprehensive energy  
843 planning.
